

DVV

The TROX DVV, a variable volume damper plate diffusers is ideal for both comfort air conditioning and industrial applications. The diffuser is mainly suitable for drop-in installation into suspended ceilings with either flat flush mount or shadow line finishes. They can be used in rooms with heights up to 4 meters.

The TROX DVV diffuser is an electronically operated unit incorporating rate aided proportional air volume and heater control. It automatically regulates the room temperature via a choice of controllers e.g. the TROX PE Controller.

According to the thermal demands in the room the controller moves the damper or cycles the heater (optional) until the room temperature reaches the set point adjusted on the controller by the user.
